Credit risk-weighted assets increased between September 2016 and December 2016. Credit-risk weighted assets was mainly driven by increased lending activity during the period, new deals and draw-downs on existing facilities offset by large repayments and currency movements on foreign denominated assets.

Securitisation risk-weighted assets reduced over the period September 2016 and December 2016 arising from reduced exposures in the period.

The risk weight attributable to equity investments is relatively high, with listed equities attracting an effective 318% and unlisted equities 424%. The impact of this is proportionately much larger increase in RWA than the associated balance sheet equity value.

Operational risk is a semi-annual calculation, required to be updated every September and March and therefore unchanged for the current reporting quarter.

Investec Bank Limited additional quarterly disclosures as at 31 December 2016
